CC antigens. The nucleic acids and proteins are used to prevent, treat (e.g., carbbite, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a common state of the state of the antigens can also be used in diagnosing a pathological condition. The antibodies to the antigens can also be used in alleviating symptoms associated with the disorders and in diagnostic communoassays e.g. radioimmunoassays or enzyme linked immunosorbent assays (ELISA). Disorders which are diagnosed or treated include autoimmune complasms of the breast or liver, cardiovascular disorders e.g. cardiac complasms of the breast or liver, cardiovascular disorders e.g. cardiac complasms of the breast of the culture, hyperproliferative disorders e.g. cardiac complete can disorders e.g. Alrheimer's disease, infections caused by complete can also be used to aid wound healing and epithelial corporates, to regenerate tissues and in chemotaxis. The polypeptides can complete capabilities, for supporting cell culture of primary completes, to regenerate tissues and in chemotaxis. The polypeptides can consider the constant, minerals, cofactors and other nutritional components. Numerous examples of diseases and disorders treated by the nucleic acids and components in the specification. The present sequence is a genomic DNA fragment from a gene encoding a foetal antigen of the constant of the printed specification, but was obtained in electronic format directly the printed specification, but was obtained in electronic format directly the printed specification, but was obtained in electronic format directly the printed specification, but was obtained in electronic format directly the printed specification, but was obtained in electronic format directly the printed specification.

```
diagnosing, treating or preventing e.g. immune disorders, or inflammatory conditions, respiratory disorders, cancers, CNS disorders, or inflammatory conditions, respiratory disorders, cancers, CNS disorders, or inflammatory conditions, respiratory disorders, cancers, CNS disorders, or inflammatory conditions or antibody fragments that bind to the polypeptides, according the polypeptides, agonists or antagonists that binds to the polypeptides are useful in preparing diagnostic or pharmaceutical compositions for diagnosing, treating or preventing an e.g. immune compositions for disposing, treating or preventing an e.g. immune compositions for conditions (e.g. inflammatory bowel disease, compirative or Crohn's disease), respiratory disorders (e.g. sathma and compositions or conditions or ischaemic brain injury), neurodegenerative disorders (e.g. parkinson's disease), and comply disorders (e.g. parkinson's disease or Alzheimer's disease), and cardiovascular disorders (e.g. atherosclerosis or myocarditis). The coplymucleotides are useful for chromosome identification, chromosome comping, for controlling gene expression through triple helix formation cor antisense DNA or RNA, in gene therapy, for identifying individuals or artisense DNA or RNA, in gene therapy, for identifying individuals or probes. The polypeptides are useful for as molecular weight markers on gels, to raise antibodies, for testing biology, and as hybridization creating or preventing neural disorders, immune system disorders (c.g. abacterial artificial chromosome (BAC) fragment containing the gene encoding one of the polypeptides of the invention. Note: The sequence corresponds to a bacterial artificial chromosome (BAC) fragment containing the gene cobatained in electronic format directly from WIPO at cot abacterial artificial chromosome (BAC) fragment containing the gene obtained in electronic format directly from WIPO at

treating or ameliorating medical conditions e.g. by protein or gene therapy. The polypeptides, nucleic acid molecules, antibodies or their fragments, and agonists or antagonists that bind to the polypeptide are useful for preparing a diagnostic or pharmaceutical composition for diagnosing or treating cancer or other hyperproliferative disorder. The polypeptides and nucleic acid molecules are also useful for detecting, preventing, diagnosing, prognosticating, treating or ameliorating cancer or other hyperproliferative disorders including neoplasms, autoimmune

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       문
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cc erythematosus, multiple sclerosis, autoimmune thyroiditis or haemolytic canaemia), haematopoietic or haematological disorders (e.g. anaemia, ct thrombocytopenia), allergic reactions including asthma or eczema, inflammatory disorders (e.g. ischaemia-reperfusion injury, inflammatory chowel disease or Crohn's disease), neurodegenerative disorders (e.g. Alzheimer's disease or Parkinson's disease), cardiovascular disorders (e.g. altherosclerosis, myocarditis), infectious diseases (bacterial, cf. ungal or viral infections including HIV/AIDS), or wound healing and cc disorders of epithelial cell proliferation. The nucleic acids are also useful for chromosome identification, radiation hybrid mapping or long-crange restriction mapping, as molecular weight markers, or as hybridization or diagnostic probes. The polypeptides and antibodies are useful for providing immunological probes for differential identification capating. ADA41655 represent DNA sequences for differential identification aDA40803-ADA4165 represent DNA sequences related to human secreted coroteins. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly crom wifo at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to novel human secreted proteins (ABR47633-CC ABR48145) and their coding sequences (ACC50344-ACC50856). The proteins CC ABR48145) and their coding sequences are useful for the preparation of a diagnostic CC or pharmaceutical composition for diagnosing or treating a cardiovascular CC disorder (e.g., arrhythmia, tachycardia, cardiac arrest, coronary CC disorder (e.g., arrhythmia, tachycardia, cardiac arrest, coronary CC arteriosclerosis and myocardial ischaemia), neural disorders, immune System disorders, muscular disorders, reproductive disorders, immune CC gastrointestinal disorders, pulmonary disorders, renal disorders, for proliferative disorders and/or cancerous diseases and conditions, for treating thrombosis and arteriosclerosis, for treating or preventing neural damage which occurs in neuronal disorders or neurodegenerative conditions such as Alzheimer's disease and Parkinson's CC disease, to enhance bone and periodonnal regeneration and aid in tissue CC transplants or bone grafts, to prevent skin aging or hair loss, to company the sequence disconstantion or proliferation or cransplantation or decrease differentiation or proliferations, to maintain CC compans before transplantation or for supporting cell culture of primary CC insues, to increase or decrease differentiation or proliferation or cembryonic stem cells, or to modulate mammalian characteristics or CC metabolism. The present sequence was used to illustrate the invention. CC format and is available from WIPO at the sequence data for this patent was published in electronic CC format and is available from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches

                                                                                                                                                                                                                                                                                                                                                                                                                     밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC ABZ71190-ABZ71478 represent cDNAs corresponding to 178 human secreted protein genes, and ABP00101-ABP00299 represent the proteins they encode. ABZ71479-ABZ71540 represent human secreted protein genomic fragments. The CC ABZ71479-ABZ71540 represent human secreted protein genomic fragments. The CC the use of the secreted proteins in drug screening, and recombinant certer groteins, nucleic acids encoding them, antibodies or antibody concerned proteins, nucleic acids encoding them, antibodies or antibody concerned groteins, and modulators of protein cativity are useful for diagnosing, treating, ameliorating or preventing digestive disorders. Such conditions include disorders of the mouth, coseophagus, stomach, small intestine, large intestine, liver, biliary creatment of proteins and include cancers of these organs and trissues. The coseophagus, stomach, small intestine, large intestine, liver, biliary creatment of immune disorders, inflammation, infection, controlled concerns of the invention may be used for chromosome identification, chromosome consping, in gene therapy, for identifying individuals from minute conspined and samples, as hybridiastion probes, and as molecular weight markers. The present sequence represents a human secreted protein genomic confident in the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                 Ś
                                                                                                                                                                                                                                                                                                       CC ADB91448 and ADB91835-ADB91911 encoding human secreted proteins ADB91449-CC ADB91834. Also disclosed is a recombinant vector comprising a polynucleotide of the invention, and a recombinant bost cell comprising the recombinant vector. The polypeptide of the invention is useful in clientifying a binding partner by contacting the polypeptide with a clientifying a binding partner by contacting the polypeptide with a composition for the polypeptide. The polypeptide, polynucleotide, antibody or its fragment, agonist or antagonist are useful for preparing a pharmaceutical composition for diagnosing or treating diabetes or conditions related to diabetes. The present sequence is that of the human immunoglobulin Fc portion used to generate fusion proteins, increasing the stability of the fused protein as compared to the secreted protein conly. Note: The sequence data for this patent did not form part of the grinted specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                      The invention describes an isolated nucleic acid molecule (1), which comprises a sequence that is at least 95 % identical to a connective tissue-related polynucleotide encoding connective tissue antigens (CTA). The polypeptide or polynucleotide is useful for preventing, treating, or ameliorating medical conditions in a mammal. The connective tissue polypeptides, polynucleotides and antibodies are particularly useful for treating, preventing and/or prognosing disorders of connective tissues (e.g. rheumatoid arthritis, discoid and systemic lupus erythematosus, replacing or Sjogren's syndrome), cancers, cancer metastases and/or neoplasias (e.g. leukaemia), neurodegenerative disorders (e.g. neoplasias (e.g. leukaemia), neurodegenerative disorders (e.g. attherosclerosis, myocarditis or cardiopulmonary bypass (e.g. attherosclerosis, myocarditis or cardiopulmonary bypass (e.g. attherosclerosis, or multiple sclerosis), allergic reactions (e.g. rheumatoid arthritis, or multiple sclerosis), allergic reactions (e.g.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /lab host="E. Coli strain XII0-Gold, T1-resistant, F-"
/clone lib="Oxytricha plasmid UUGCIO library"
/note="Vector: PWD42nv; Purified macronuclear chromosomal DNA from Oxytricha trifallax was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. Vector DNA was prepared from a derivative of pWD42 (gil4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. Coli XII0-Gold (Stratagene) cells and selected for ampicillin resistance."

//note="Vector: PMD42nv; Purified macronuclear chromosomal NNA from Oxytricha trifallax was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. Vector DNA was prepared from a derivative of pMD42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. Coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     74 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. Vector DNA was prepared from a derivative of pWD42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. Coli XIIO-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /lab host="E.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Email: est@watson.wustl.edu
The library was constructed by Claire Murphy and Dr. Makedonka
Dautova at Washington University, St. Louis
(mdautova@watson.wustl.edu). The cDNA was made by using Dynabead
oligo-dT priming (Dynal). PCR based library using a modified
protocol from the SMART PCR CDNA Synthesis Kit from Clontech.
Directionally cloned into the UDG sites of pAMP1. Heterodera
schachtii J2 were provided by Bartel Vanholme of Ghent University
Possible reversed clone: similarity on wrong strand
Seq primer: -40Rp from Gibco.

/note="Vector: pAMP1, Site 1: Not I; Site 2: Sal I; The
library was constructed by Claire Murphy and Dr. Makedonka
Dautova at Washington University, St. Louis
(mdautova@watson.wustl.edu). The cDNA was made by using
Dynabead oligo-dT priming (Dynal). PCR based library using
a modified protocol from the SMART PCR cDNA Synthesis Kit
from Clontech. Directionally cloned into the UDG sites of
pAMP1. Heterodera schachtii J2 were provided by Bartel
Vanholme of Ghent University (Bartel.Vanholme@rug.ac.be)."

Coli strain Xilo-Gold, Tl-resistant, F-"
/clone lib="Oxytricha plasmid UUGCIO library"
/note="Vector: PMD42nv; Purified macronuclear chromosomal
DNA from Oxytricha trifallax was blunt end-repaired with
T4 DNA polymerase and T4 polymucleotide kinase. Adaptor
oligonucleotides were ligated to the blunt ends in high
molar excess. Vector DNA was prepared from a derivative of
pWD42 (gi|4732114|gb|AF129072.1), a copy-number inducible
derivative of plasmid R1. The vector was ligated with
adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. Coli Xilo-Gold (Stratagene) cells
and selected for ampicillin resistance."

//note="Vector: PMD42nv; Purified macronuclear chromosomal DNA from Oxytricha trifallax was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. Vector DNA was prepared from a derivative of pWD42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. Coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             USA

Coli strain XL10-Gold, T1-resistant, F-"
/clone_lib="Oxytricha plasmid UUGC10 library"
/note="Vector: PMD42nv; Purified macronuclear chromosomal
DNA from Oxytricha trifallax was blunt end-repaired with
T4 DNA polymerase and T4 polymucleotide kinase. Adaptor
oligonucleotides were ligated to the blunt ends in high
molar excess. Vector DNA was prepared from a derivative of
pWD42 (gif4732114|gb|AF129072.1), a copy-number inducible
derivative of plasmid R1. The vector was ligated with
adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. Coli X110-Gold (Stratagene) cells
and selected for ampicillin resistance."

/note="Vector: PMD42nv; Purified macronuclear chromosomal note="Vector: PMD42nv; Purified macronuclear chromosomal polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. Vector DNA was prepared from a derivative of pWD42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. Coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            USA

Coli strain XL10-Gold, T1-resistant, F-"
/clone lib="Cxytricha plasmid UUGC10 library"
/clone lib="Cxytricha plasmid UUGC10 library"
/note="Vector: PWD42vv; Purified macronuclear chromosomal
DNA from Cxytricha trifallax was blunt end-repaired with
T4 DNA polymerase and T4 polymucleotide kinase. Adaptor
cligonucleotides were ligated to the blunt ends in high
molar excess. Vector DNA was prepared from a derivative of
pWD42 (gil4732114 | gb | AFT129072.1), a copy-number inducible
derivative of plasmid R1. The vector was ligated with
adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. Coli XII0-Gold (Stratagene) cells
and selected for ampicillin resistance."

Colistrain XI10-Gold, T1-resistant, F-"
/clome lib="Oxytricha plasmid UUGC10 library"
/note="Wector: PMD42nv; Purified macronuclear chromosomal
DNA from Oxytricha trifallax was blunt end-repaired with
T4 DNA polymerase and T4 polymucleotide kinase. Adaptor
oligonucleotides were ligated to the blunt ends in high
molar excess. Vector DNA was prepared from a derivative of
pWD42 (gil4732114 |gb|AF129072.1), a copy-number inducible
derivative of plasmid R1. The vector was ligated with
adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. Coli XI10-Gold (Stratagene) cells
and selected for ampicillin resistance."

Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. Vector DNA was prepared from a derivative of pM042 (gi 4732114 gb AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. Coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance." Sequence 4, Application US/10603260

Publication No. US20040009570A1

GENERAL INFORMATION:

APPLICANT: CJ COPPORATION:

TITLE OF INVENTION: An alkaline lipase from Vibrio metschnikovii RH530 and a TITLE OF INVENTION: nucleotide sequence encoding the same FILE REFERENCE:

CURRENT APPLICATION NUMBER: US/10/603,260

CURRENT FILING DATE: 2003-06-24

NUMBER OF SEQ ID NOS: 5

SOFTWARE: Kopatentin 1.71

SEQ ID NO 4

SEQ ID NO 4

ORGANISM: Vibrio metschnikovii RH530

FEATURE:

NAME/KEY: CDS

LOCATION: (1)..(555)

OTHER INDRAMATION: vall2 gene
